The Problem of Accuracy, Cost, And Efficiency

Animal Recognition Using Different Machine Learning Frameworks

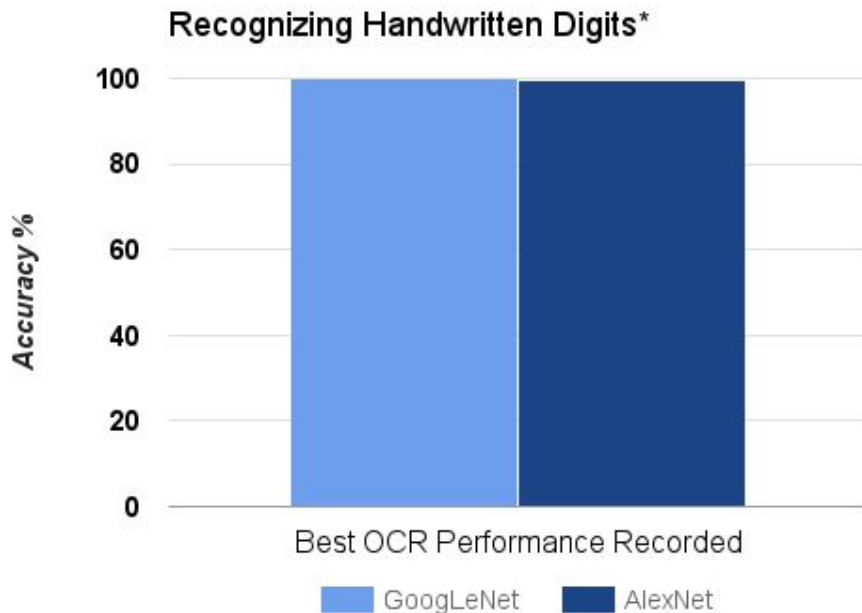

Output: "Bear"

Output: "None"

Using Convolutional Neural Networks (CNN) to Recognize Animals

- Almost every highly ranked team used CNN as their basic framework

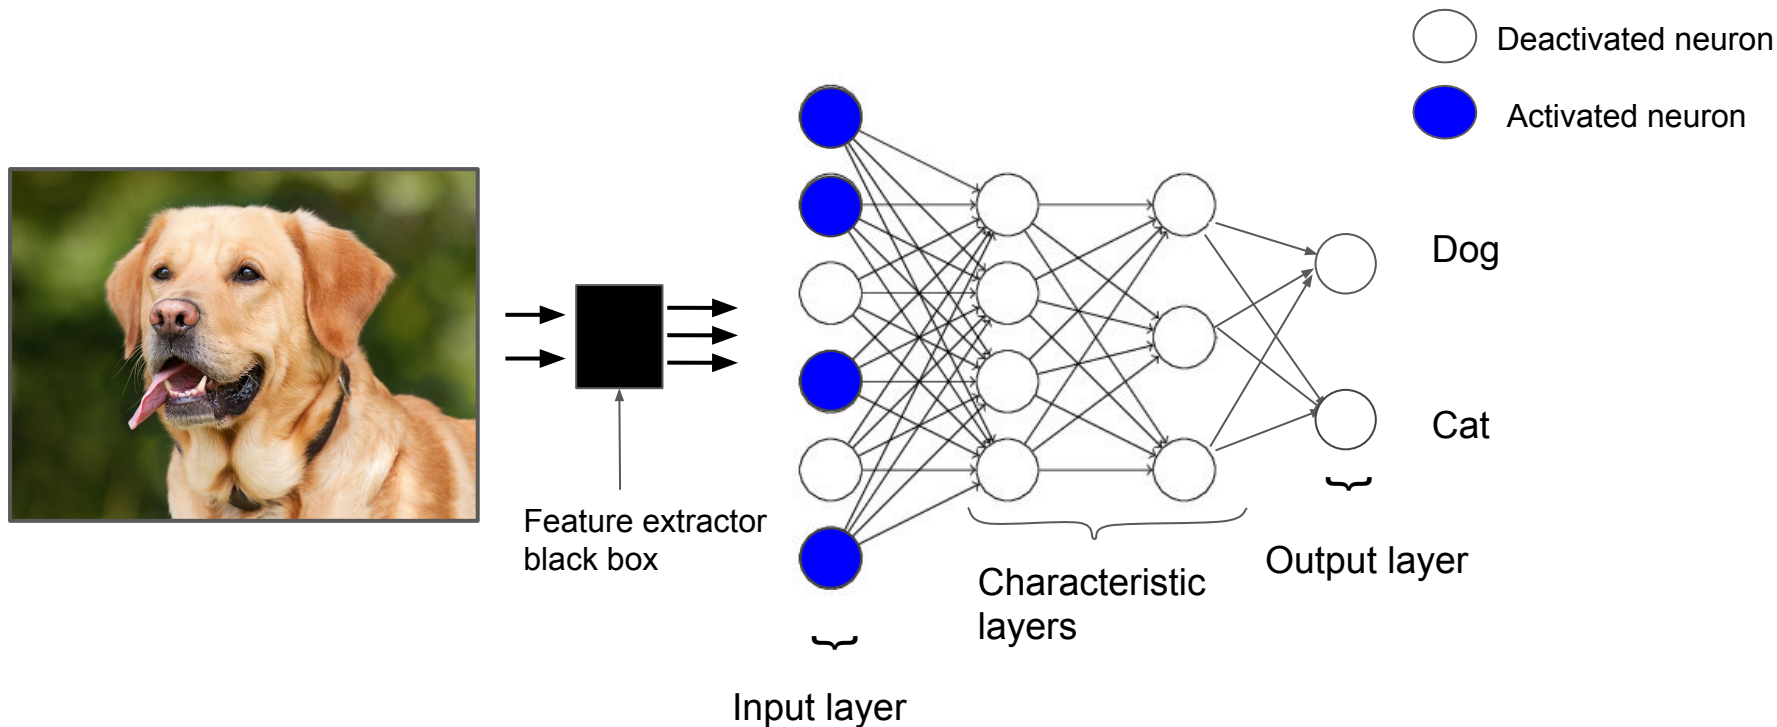

- Foundation of GoogLeNet and AlexNet

-Zhong, Zhuoyao et al. "High Performance Offline Handwritten Chinese Character Recognition Using GoogLeNet and Directional Feature Maps."

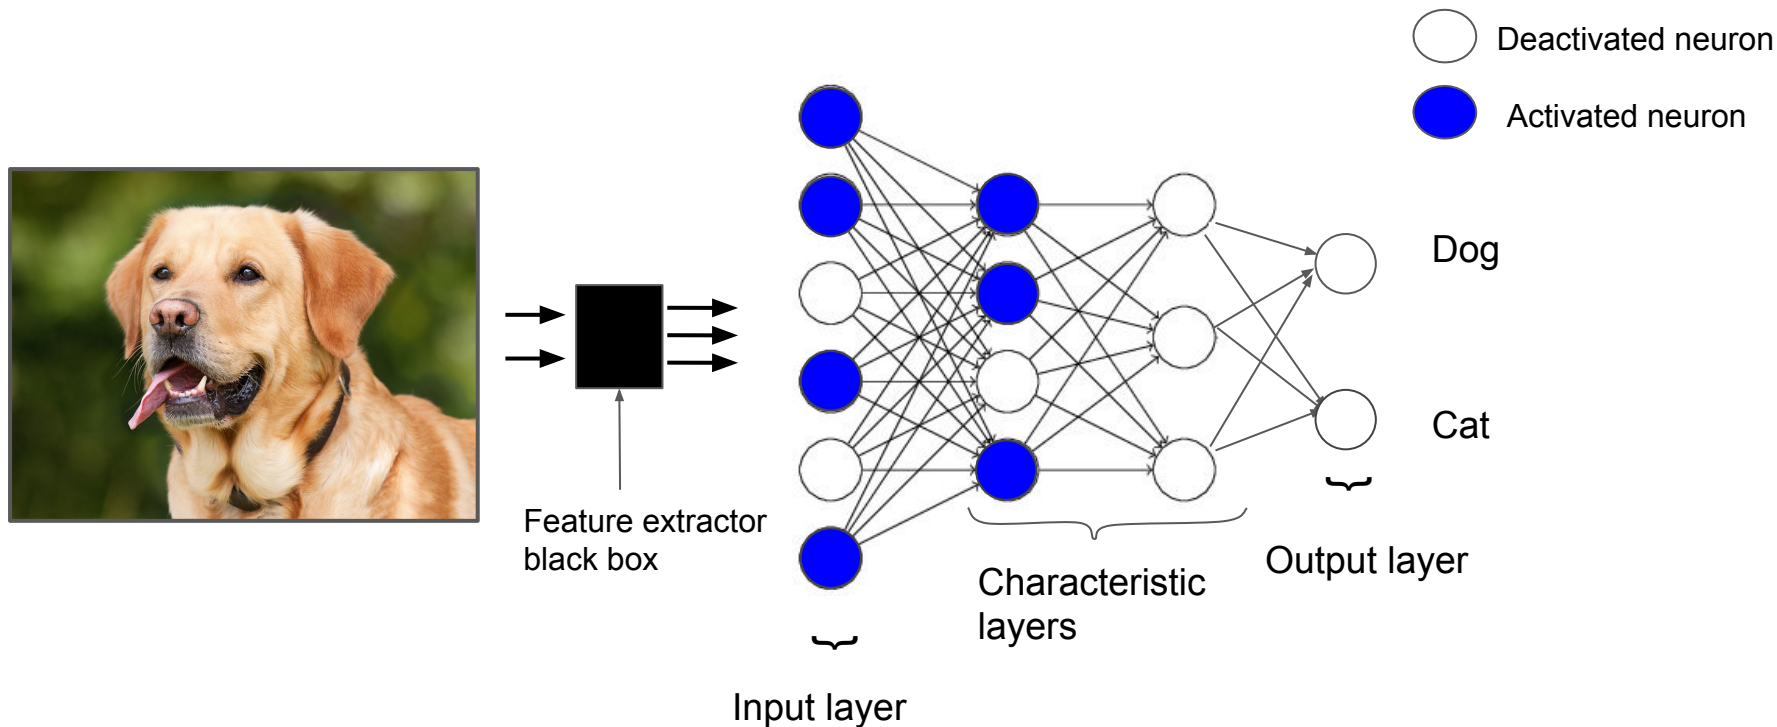

-"Multi-column deep neural networks for image classification". *2012 IEEE Conference on Computer Vision and Pattern Recognition*

-Ciresan, Dan; Ueli Meier; Jonathan Masci; Luca M. Gambardella; Jurgen Schmidhuber. "Flexible, High Performance Convolutional Neural Networks for Image Classification"

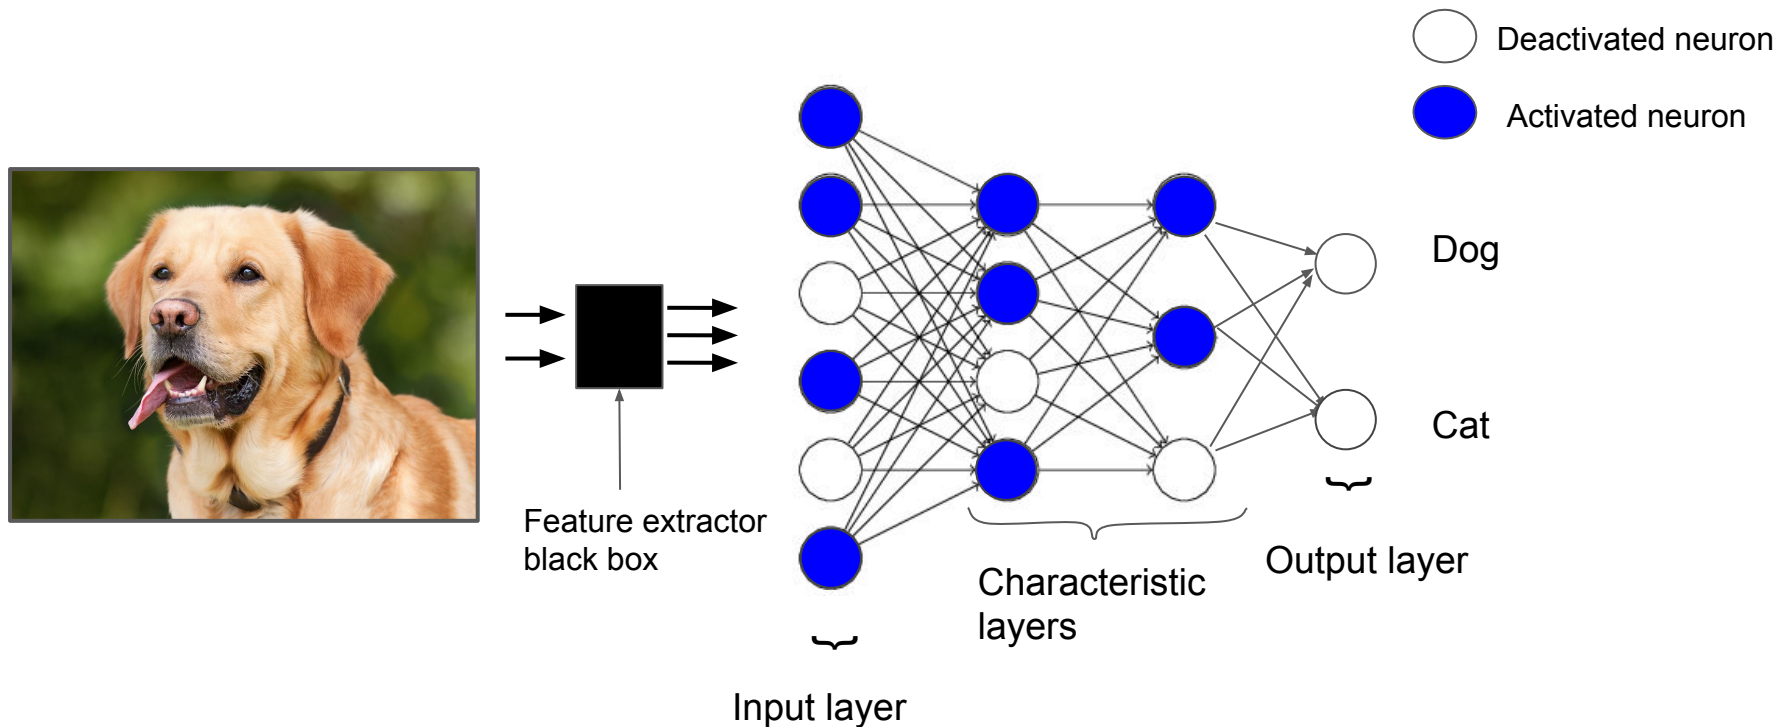

How Convolutional Neural Networks Classify Images

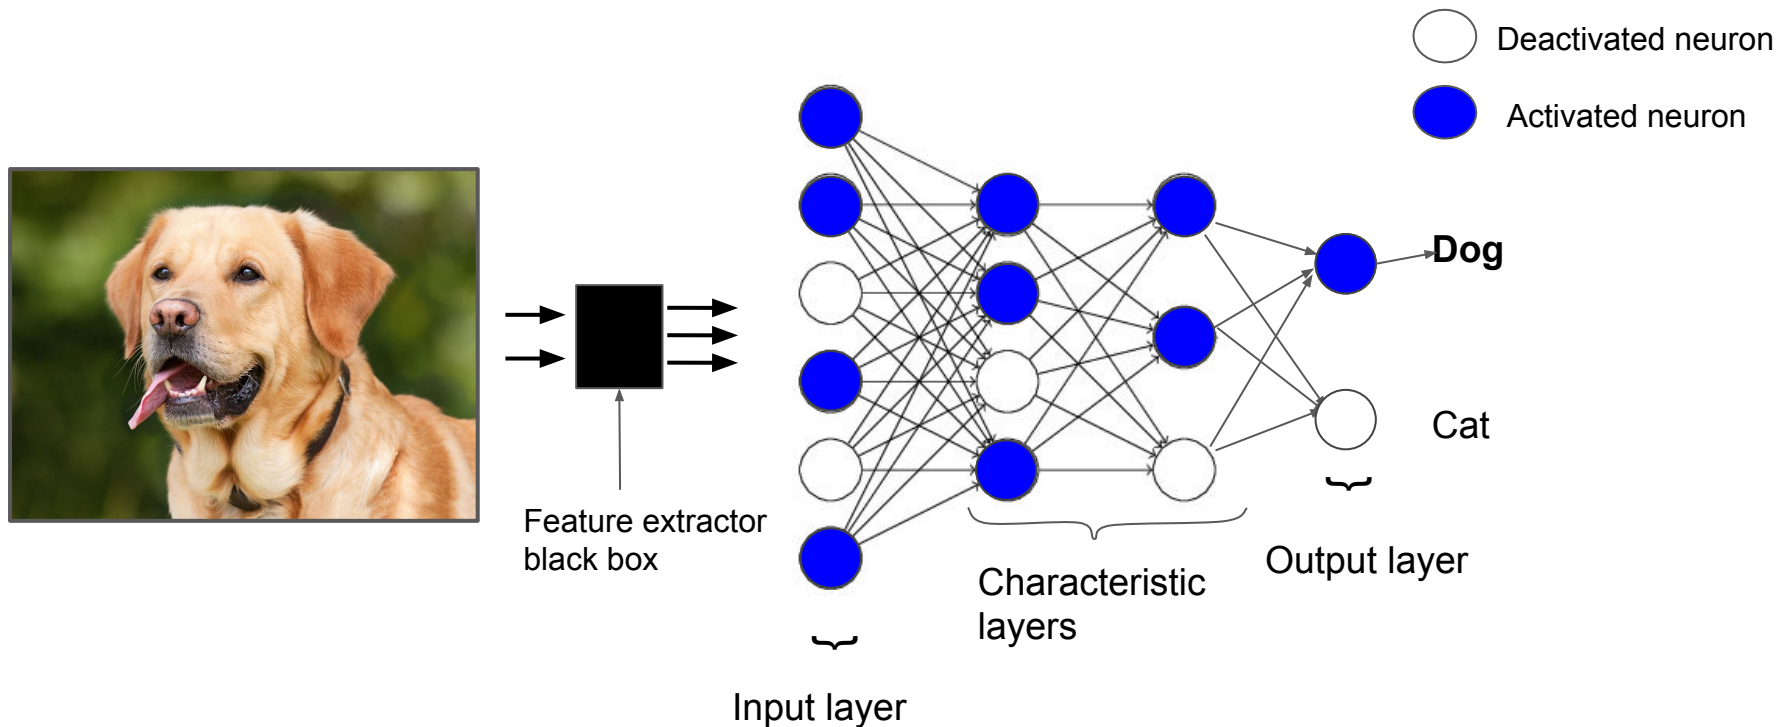

How Convolutional Neural Networks Classify Images

How Convolutional Neural Networks Classify Images

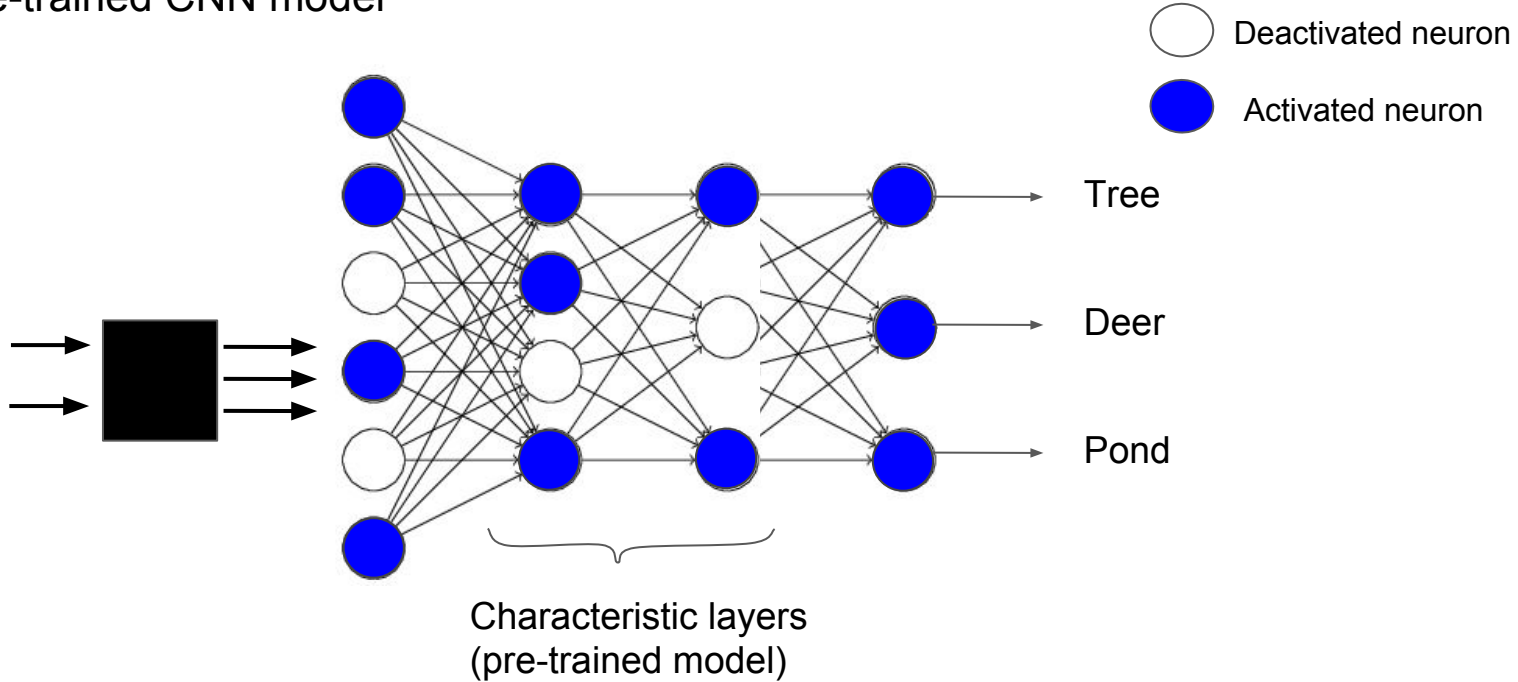

How Convolutional Neural Networks Classify Images

Re-training an Existing CNN Model

- Use a pre-trained CNN model

Re-training an existing CNN Model

- Use a pre-trained CNN model
- Add an extra filtering layer

Results After Classifying 12210 Images Using Pre-trained CNN Model

TensorFlow - Top 5 Categories

Results After Classifying 12210 Images Using TensorFlow Re-trained In Four Categories

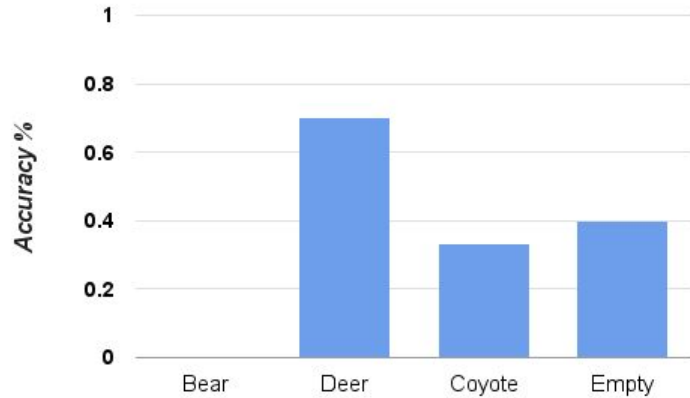

Re-training Dataset:

- Bear: 170 images
- Deer: 489 images
- Coyote: 259 images
- Empty/other: 21 images

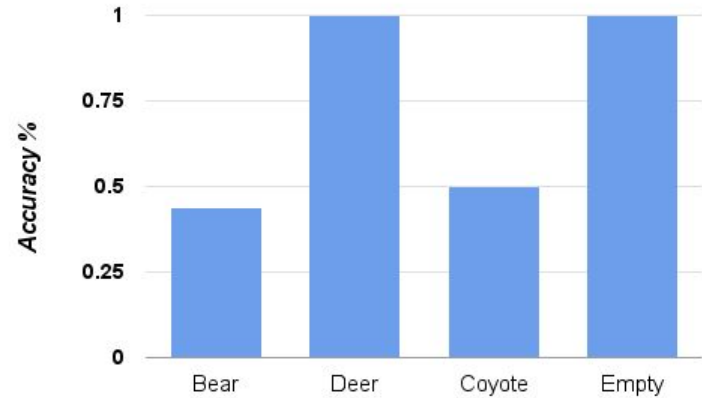

Accuracy of TensorFlow: Before And After Re-Training

No Re-training

Average accuracy: 35%

Retrained in four categories

Average accuracy: 73%

Metadata Extraction & Fusion

- Learn more about how animals are affected by the environment.
- Analyze this data to learn more about certain species.

2013-11-16 1:01:25 AM M 10/10 50°F

Extracting metadata from images

- Time and date can be extracted from the EXIF data
- Temperature needs to be recognized using OCR

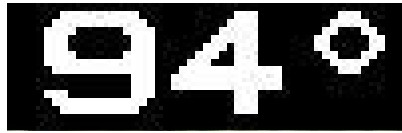

94°F

Camera:	Reconyx HC500 HYPERFIRE
Exposure:	Auto exposure, $\frac{1}{30}$ sec, ISO 800
Flash:	Auto, Fired
Date:	January 1, 2016 6:30:55AM (timezone (6 months, 25 days, 17 hours, 52 minutes, 17 s Pacific)
File:	1,920 × 1,080 JPEG (2.1 megapixels) 248,746 bytes (243 kilobytes)

Recognizing temperature digits using OCR

Have temperature digits recognized automatically

A pixelated, high-contrast black and white image of the text "94°". The digits "9" and "4" are rendered in a simple, blocky font, and the degree symbol "°" is also pixelated. The entire image is set against a solid black rectangular background.

Recognizing temperature digits using OCR

Have temperature digits recognized automatically

Training phase - labeling digits

Label each digit in the font family in order to train the model

0 1 2 3 4 5 6 7 8 9 -

Manual labeling

0 1 2 3 4 5 6 7 8 9 -

Recognizing temperature digits using OCR

- The trained model will recognize any unlabeled character
- Which number is the “nearest” in similarity with the labeled data

Collecting metadata with hidden, motion-triggered cameras at the Sedgwick Reserve

New OCR

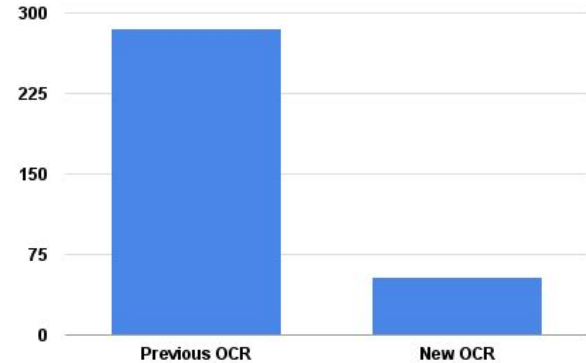

Analyzing the accuracy and processing time of both OCR algorithms

Accuracy %

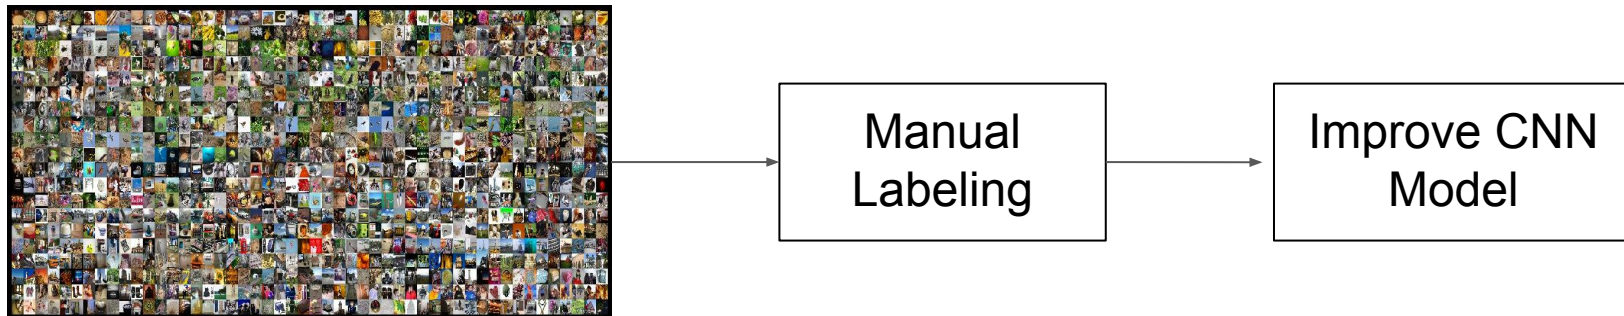

Time in seconds

The Road Ahead

- Re-train TensorFlow with labeled images from Sedgwick Reserve
- Collect more data to build a bigger dataset
- Move everything to the cloud

Recognizing temperature digits using OCR

- We need to automatically have these numbers recognized

94°

Recognizing temperature digits using OCR

- We need to automatically have these numbers recognized
- Find the edges on the image

Recognizing temperature digits using OCR

- We need to automatically have these numbers recognized
- Find the edges on the image
- With the edges, we know the dimensions of each digit/symbol

Recognizing temperature digits using OCR

- We need to automatically have these numbers recognized
- Find the edges on the image
- With the dimensions, we ignore characters with small area (degree symbol)

- However, numbers are still unlabeled
