

Engineering Nanoparticle Shape to Deliver to 3D Tumor

Dilpreet Kaur

Mentor: Sutapa Barua, PhD

Professor Samir Mitragotri

University of California, Santa Barbara

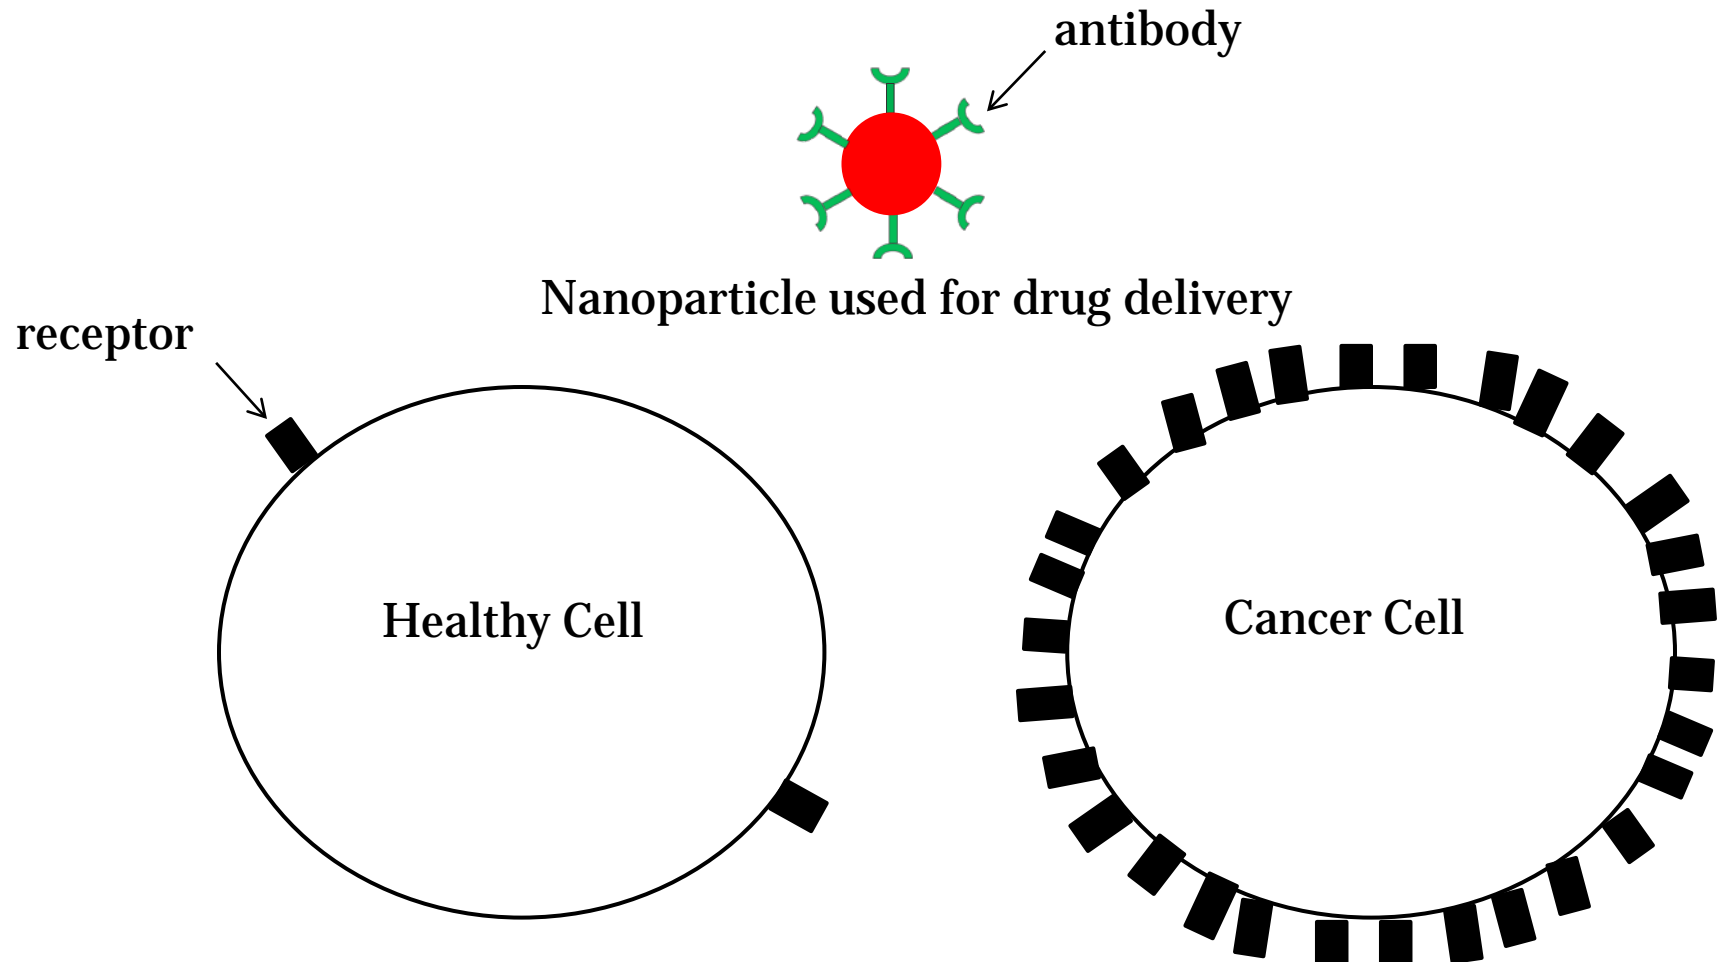

Department of Chemical Engineering

August 28th, 2013

Targeted Therapy for Cancer Treatment

Targeted Therapy

Previous Study: Nanorods Target Better than Nanospheres

Nanorods have greater bonding to cancer cell surfaces than nanospheres

Objectives

Improving Therapeutic Efficiency of Anti-Cancer Drugs

Hypothesis: Rods penetrate cells more than spheres

Methods: Preparation of Nanoparticles

Polystyrene
Particles

rod

Spherical shaped
nanoparticles in a
polyvinyl alcohol
(PVA) film

PVA film is
allowed to set
for 18 hours

Place PVA
film in metal
stretcher and
heat

Stretch
PVA film;
Prepare
nanorods

Nanosphere and Nanorod Images

Scanning Electron Microscopy (SEM)

Nanosphere
(200 nm)

Nanorod
(300 nm x 100 nm)

Nanoparticles were coated with a targeting antibody, Herceptin

Methods: In vitro 3-D Tumor Growth and Imaging

3-D Breast cancer cells treated with
Herceptin-coated nanospheres and nanorods

24 Hour Incubation

Visualize the nanoparticle penetration and quantify the differences

Visualizing Nanoparticles in 3-D Breast Cancer Cells

Key:

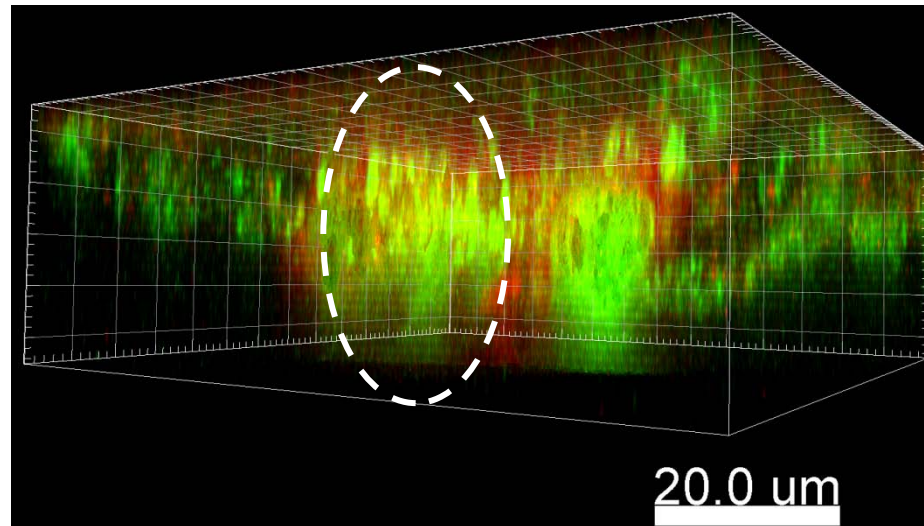

nanosphere

nanorod

Confocal microscopy allows analysis of nanoparticle penetration in 3-D cells

Comparing Nanorod vs. Nanosphere Penetration in 3-D Cells

Key:

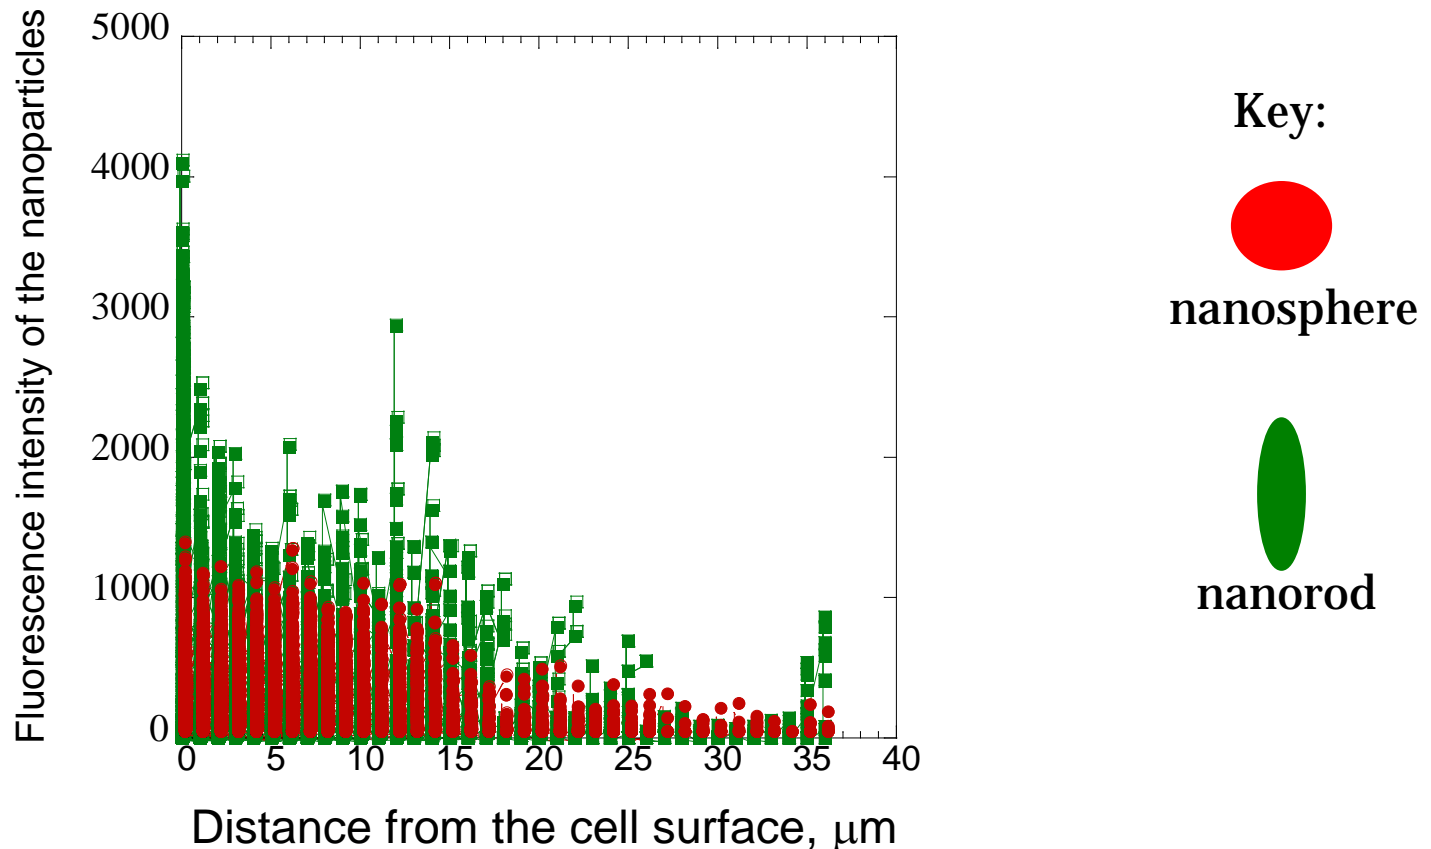

nanosphere

nanorod

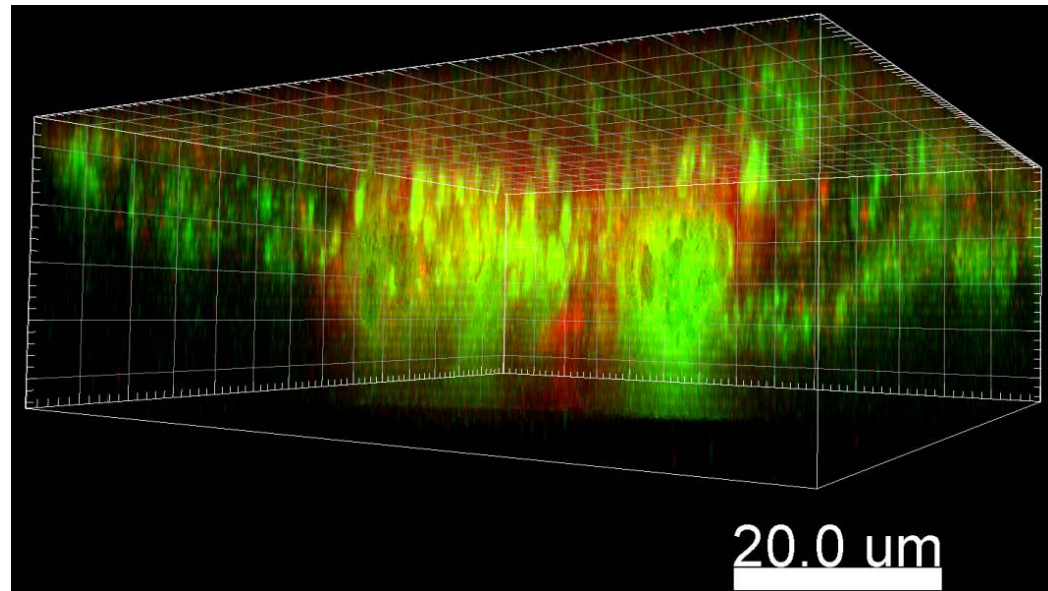

We used a 3D imaging software to measure the penetration of the nanoparticles into cells

Quantitative Measurements of Nanoparticle Fluorescence Intensity

Nanorods penetrated deeper into the cells than nanospheres

Summary

Application in drug delivery to complex tissues

Future Work

Thank you!

- Samir Mitragotri, my mentor Sutapa Barua, and Maarten Bakker
- Arica, Ofiela, Maria, Kevin and the CSEP Staff

UCSB

...and the audience for listening!

Sliced view into the cells
